Statement

1. Implementation. The softwares of the CUCKOO Workgroup are implemented in JAVA (J2SE). Usually, both of online service and local stand-alone packages will be provided.

2. Availability. Our softwares are freely available for academic researches. For non-profit users, you can copy, distribute and use the softwares for your scientific studies. Our softwares are not free for commercial usage.

3. GPS. Previously, we used the GPS to denote our Group-based Phosphorylation Scoring algorithm. Currently, we are developing an integrated computational platform for post-translational modifications (PTMs) of proteins. We re-denote the GPS as Group-based Prediction Systems. This software is an indispensable part of GPS.

4. Usage. Our softwares are designed in an easy-to-use manner. Also, we invite you to read the manual before using the softwares.

5. Updation. Our softwares will be updated routinely based on users’ suggestions and advices. Thus, your feedback is greatly important for our future updation. Please do not hesitate to contact with us if you have any concerns.

6. Citation. Usually, the latest published articles will be shown on the software websites. We wish you could cite the article if the software has been helpful for your work.

7. Acknowledgements. The work of CUCKOO Workgroup is supported by grants from Chinese 973 project (2002CB713700, 2006CBOF0503, and 2006CB933300), Chinese Academy of Sciences (KSCX1-YW-R65, KSCX2-YW-21, and KJCX2-YW-M02), Chinese Natural Science Foundation (39925018, 30270293, 90508002, 30700138) and National Institutes of Health (DK56292).
Introduction

The graphical representation of biological sequences is fundamental for the efficient interpretation of scientific achievements in the research of biochemistry and molecular biology. Schematic diagram with biological sequences drawing in an aesthetic and illustrative way is not only crucial for the publication of scientific works, but also important for academic exchanges. Therefore, the drawing of biological sequences is now becoming one of the essential skills for biology researchers. Generally, the Microsoft PowerPoint, Adobe Illustrator and Photoshop are three pieces of widely-used software that can assist the preparation of biological diagram. However, due to the complexity, it will take quite some time to be familiar with their operation. Besides, the scale of a schematic diagram generated by these tools is usually approximate. When drawing with those tools, neither the locations of functional domains nor the positions of functional sites can be precisely designated in the biological sequences.

Early in 2009, our research group have developed a novel software called Domain Graph 1.0 (DOG 1.0) for helping the presentation of protein functional domain. Up to May, 2014, DOG 1.0 was cited by 62 published works and assisted numerous researchers in preparing their research achievements. However, as DOG 1.0 was specifically designed for protein presentation, it may be inconvenient for illustrating nucleotide diagram. Also, the nucleotide diagram drew by DOG 1.0 may usually not satisfy the general style. Thus, development of a new software that not only apply to protein domain graph preparation but also to nucleotide presentation will be necessary for the community.

In this work, we present a brand new tool called IBS 1.0 for assisting experimentalists in drawing high-quality schematic diagram of biological sequences. With a dual-mode user interface, experimentalists are allowed to produce their own schematic diagram for both protein and nucleotide sequences in a convenient manner. To provide a drawing environment without restriction, abundant graphical elements, such as polygon, bracket, curve and polyline, were available. Furthermore, drawing under our professional renderers, the schematic diagrams will be generated in a more aesthetic and concise appearance.
Download & Installation

The IBS 1.0 software was implemented in JAVA 1.6 (J2SE 6.0), and could be installed on three major Operating Systems (OS), including Windows, Linux/Unix or Mac OS X systems. The local stand-alone packages of IBS 1.0 can be freely available at http://dog.biocuckoo.org/software.php. We recommend that users could download the latest release.

Please choose the proper package to download. After downloading, please double-click on the software package to begin installation, following the user prompts through the installation. The snapshots of the setup program for windows are shown below:
License Agreement

Please read the following important information before continuing.

Please read the following License Agreement. You must accept the terms of this agreement before continuing with the installation.

IMPORTANT-READ CAREFULLY: This End-User License Agreement ("EULA") is a legal agreement between you (either an individual or a single legal entity) and The CUCKOO Workgroup, which covers your use of Group-based Prediction System and related software components ("Software Product" or Group-based Prediction System).

A software license ("Software Product License"), issued only by The CUCKOO Workgroup or its authorized agents to a designated user may allow you to use the Software Product.

- I accept the agreement
- I do not accept the agreement

Select Destination Directory

Where should IBS 1.0 be installed?

Select the folder where you would like IBS 1.0 to be installed, then click Next.

Destination directory:

Required disk space: 99.1 MB
Free disk space: 73,442 MB
Finally, please click on the Finish button to complete the setup program.
The IBS work environment

Startup Interface

In IBS 1.0, a dual-mode user interface was developed. After the initial startup of IBS 1.0, a selection dialog appears as below. Through this dialog, you can choose to work in either protein mode or nucleotide mode.

Protein mode is activated.
Nucleotide mode is activated

After choosing the working mode, IBS activates the work environment, including the Canvas, Console panel, Component List, Shape toolbar and Menus. Also, there are several protein and nucleotide examples included in the software. Randomly, two schematic diagrams were selected as below:
The instance for protein mode

G Liang, J He, Y Zhang - Nature Cell Biology 14,457- 466(2012)
The instance for nucleotide mode

**Canvas**

Display the graph of the current project.
You can use the keyboard **UP/DOWN** or mouse **Wheel Up/Wheel Down** to zoom in/out the graph. You can also use the right-Click popup menu to adjust the graph.

**Console**

This panel contains five option buttons for drawing protein or nucleotide domain structures.

**The console panel in protein mode**

**The console panel in nucleotide mode**

1. **Protein (or Nucleotide)** button: Define the basic properties of the current protein (or Nucleotide).
2. **Domain** button: Add a functional domain to the current protein (or Nucleotide).
3. **Site** button: Add short motif or functional site to the current protein (or Nucleotide).
4. **Cut Line** button: add cut elements, add cut effect on protein (or nucleotide).
5. **Note** button: Add comments of the current protein (or nucleotide).
6. **Zoom drop-down box**: Select a zoom ratio for the canvas.
7. **Grayscale checkbox**: When selected, the image turn into a grayscale image. Conversely, color image.
Component List

List all the components of the current project, including protein, domain, site and note. Different components could be marked in different colors and major properties.

You can use the Right-Click popup menu to edit, delete or insert a new component before the selected component.

You can also double click a component to edit it.

The shape toolbar

The basic operational commands and commonly-used drawing elements are included in the toolbar.

1. **Undo** : Undo the last operation.
2. **Redo** : Redo the previous operation.
3. **Note** : Add note.
5. **Bracket** : Draw square and braces bracket.
7. **Curve** : Draw a curve with one control point.
8. **Polyline with two knuckle point** : Draw a polyline with two knuckle points.
9. **Bezier curve** : Draw a Bezier curve with two control points.
10. **Polyline with one knuckle point**  

: Draw a polyline with one knuckle point.

---

**Menus**

**File Menu**

![File Menu](image.png)

**New project**  
Open a new and untitled IBS project.

**Open project**  
Display a dialog box allowing you to open an existing IBS project file and display the contents in a new canvas.

**Save**  
Save the contents of the current project in XML format as a file in the current directory or folder on the disk. If this is the first time that you are saving the file, you must enter a file name. If the file has been saved before, the existing file name is used.

**Caution:** The Save command will overwrite any file with the same name that is in the same directory or folder! If you do not want to do this, choose File -> Save As and give the file a different name.

**Save As...**  
Display a dialog box allowing you to save the contents of the current project in XML format as a file, with a file name that you provide.

**Export Image**
Export image in PNG, JPEG, TIFF or SVG format to a file on the disk.

**Exit**
Close the current project and exits the current IBS session. A dialog asks if you want to save or abandon the changes, or cancel the command.

**Edit menu**

**Edit menu in protein mode**

- Add Protein
- Add Domain
- Add Site
- Add Culline
- Add Note
- Add Bracket
- Add Straight Line
- Add Curve
- Add Bezier Curve
- Add Polyline with Two Knuckle Points
- Add Polyline with One Knuckle Point

**Edit menu in nucleotide mode**

- Add Nucleotide
- Add Domain
- Add Site
- Add Culline
- Add Note
- Add Bracket
- Add Straight Line
- Add Curve
- Add Bezier Curve
- Add Polyline with Two Knuckle Points
- Add Polyline with One Knuckle Point

**Canvas Size**

- Undo Ctrl+U
- Redo Ctrl+E
Add Protein
Add a new protein.

Add Nucleotide
Add a new nucleotide.

Add Domain
Add a functional domain to the current protein or nucleotide.

Add Site
Add short motif (usually<15aa/bp) or functional site to the current protein or nucleotide.

Add Note
Add name of the current protein or nucleotide.

Add Bracket
Add a bracket to the current protein or nucleotide sequence.

Add Straight Line
Add a straight line to the current protein or nucleotide sequence. By double-clicking the element, the style of straight line can change to arrow, double arrow, scale arrow or double-scale arrow.

Add Curve
Add a curve with one control point to the current protein or nucleotide sequence. By double-clicking the element, the style of curve can be change to arrow, double arrow, scale arrow or double-scale arrow.

Add Bezier Curve
Add a bezier curve with two control points to the current protein or nucleotide sequence. By double-clicking the element, the style of Bezier curve can be change to arrow, double arrow, scale arrow or double-scale arrow.

Add Polyline with Two Knuckle Points
Add a polyline curve with two control points to the current protein or nucleotide sequence. By double-clicking the element, the style of polyline can be change to arrow, double arrow, scale arrow or double-scale arrow.

Add Polyline with One Knuckle Point
Add a polyline curve with one knuckle point to the existing protein or Nucleotide sequence. By double-clicking the element, the style of polyline can be change to
arrow, double arrow, scale arrow or double-scale arrow.

**Add Line**
Add lines of 4 types: Line, Arrow, Double Arrow, Scale.

**Canvas size**
Set the size of current canvas.

**Undo**
Undo the last operation.

**Redo**
Redo the previous operation.

**Tool menu**

![Tool menu image]

**Demo**
We randomly re-drew domain graphs for 35 distinct proteins and several nucleotides from four journals, including Cell, Nature Cell Biology (NCB), The Journal of Cell Biology (JCB), Molecular Biology of the Cell (MBC) and Molecular and Cellular Biology (MCB). These instances could be browsed software demos.
Batch Export Images

With this tool, you can batch export images from IBS projects into JPG(72dpi), PNG(72dpi), TIFF(300/600dpi) or SVG(vector image) format.

Image Format

With this tool, you can convert images in JPG, PNG or GIF format to TIFF format with a resolution of 300-1200dpi.
Batch Export Images in Command Line

You can also use the command line version to batch export images from IBS projects. Five different types of image formats, such as JPG(72dpi), PNG(72dpi), TIFF(300/600dpi), SVG(vector image), are supported in the command line. When you are exporting image in high resolution (under 300 or 600 dpi), please ensure that the physical memory in your computer are of sufficient size. To guarantee a proper functionality, you need at least 512M memory.

Export Images with a Configuration File

To batch export images in the command line, you can provide a configuration file that specify detail parameters. The syntax of the configuration file are describe below:

**xmlpath**: The directory that contains a set of IBS project files (xml format).
**Picpath**: The directory where you want to export the image to.
**format**: The output format. The following formats are support:
- A:JPG (72dpi),
- B:PNG (72dpi),
- C:TIFF (300dpi),
- D:TIFF (600dpi),
- E:SVG (vector image)
**unit**: The unit type. Four unit types (pix, cm, mm, inch) are allowed.
**width**: The width of the output image.
**heigh**: The height of the output image.
**ratio**: Whether to keep the ratio of width/height while exporting the image. TRUE/FALSE are allowed.
Here is an example for the configuration file:

```
xmlpath = demo/nucleotide
picpath = output
format = D
unit = cm
width = 18
height = 14
ratio = false
```

You can use the following command to begin the exportation:

```
java –jar –Xmx 512m IBS.jar –c Config.txt
```

Where –Xmx sets the maximum memory heap size, -c sets the location of a configuration file.

**NOTE:** A minimal memory of 512 MB is required while exporting high resolution image.

### Export Image without Configuration File

You can also export the IBS projects in command line without using the configuration file. The detail commands are presented below:

- **-x:** The directory that contains a set of IBS project files (xml format).
- **-p:** The directory where you want to export the image to.
- **-f:** The output format. The following formats are support:
  - A:JPG (72dpi),
  - B:PNG (72dpi),
  - C:TIFF (300dpi),
  - D:TIFF (600dpi),
  - E:SVG (vector image)
- **-u:** The unit type. Four unit types (pix, cm, mm, inch) are allowed.
- **-w:** The width of the output image.
- **-h:** The height of the output image.
- **-r:** Whether to keep the ratio of width/height while exporting the image. TRUE/FALSE are allowed.

Here is an example for the command line:

```
java -jar -Xmx512m IBS.jar -x demo/nucleotide -p output -f D -u cm -w 25 -h 18 -r false
```
Where –Xmx sets the maximum memory heap size. **Note that, a minimal memory of 512 MB is required while exporting high resolution image.**

All the help information can be seen and printed using the following command:

```
java –jar IBS.jar –help
java –jar IBS.jar –h
```
Illustration of Protein and Nucleotide Domain Structures

New Protein

When you click on the **Protein** button or choose **Edit -> Add Project**, a new protein feature dialog box will appear as shown below:

![Protein Feature Dialog Box]

The right area of the property dialog box contains the following settings for the protein:

1. **The ID panel**
   - **ID**: A unique ID can be indicated for the current element in this textfield. When the element is created, a default ID value will be automatically indicated. Users are allowed to modify the default value. When inputting a new value, the characters will turn black from gray.

2. **The position panel**
   - **Start**: Assign a start position for the protein sequence.
**End:** Assign an end position for the protein sequence.

**Height:** Assign the height for the protein sequence. Default value is 25.

**Vertical:** The vertical offset to the center of the current canvas.

**Horizontal:** The horizontal offset to the center of the current canvas.

**Locked:** A checkbox for restricting the horizontal movement of a protein sequence. When the option is selected, a horizontal movement is prohibited.

3. **The style panel**
   - **Color:** Select a color for the current protein from the chooser dialog.
   - **Gradient:** Select a color gradient for the current protein.
   - **Texture:** Select a texture for the current protein.
   - **Font Size:** Select the font size of the position number.

4. **The border panel**
   - **Line size:** Change the border size of the current protein.
   - **Dash:** A checkbox for altering the border line into dash line.
   - **Line color:** Select a color for the border line from the chooser dialog.

**Note:** For convenience, the “Preview” panel shows the effect of current figure.

The IBS version 1.0 supports multi-protein display. You can add two or more proteins in a canvas.
New Nucleotide

When you click on the *Nucleotide* button or choose **Edit -> Add Nucleotide**, a new nucleotide feature dialog box will appear as shown below:

![Nucleotide Feature Dialog]

As shown in the nucleotide feature dialog, the settings for nucleotide sequence were identical to protein mode.
Similarly, the nucleotide mode interface supports multi-nucleotide display. You can add two or more nucleotides in a canvas.

**Add Domain (In protein mode)**

When you click the **Domain** button or choose **Edit -> Add Domain** in protein mode interface, a domain property dialog box will appear as shown below:
The right area of the property dialog box contains the following settings for the domain:

1. **The ID panel**
   - **ID:** A unique ID can be indicated for the current domain in this textfield. When the domain is created, a default ID value will be automatically indicated. Users are allowed to modify the default value. When inputting a new value, the characters will turn black from gray.

2. **The position panel**
   - **Start:** Assign a start position for the protein domain.
   - **End:** Assign an end position for the protein domain.

3. **The text panel**
   - **Name:** Name of the domain.
   - **Location:** A combo box to set the name of the domain display above, under or inside the domain or not display at all.
   - **Font:** Select the font size of the domain name.
   - **Text Color:** Select the font color of the domain name.

4. **The style panel**
   - **Color:** Select a color for the current domain from the chooser dialog.
**Gradient:** Select a color gradient for the current domain.
**Texture:** Select a texture for the current domain.

5. **The border panel**
   - **Line size:** Change the border size of the current domain.
   - **Dash:** A checkbox for altering the border line into dash line.
   - **Line color:** Select a color for the border line from the chooser dialog.

**Note:**

You can use the position direction combo box to set the start and end position texts display above or under the domain or not display at all.

**Down:**

**Up:**

**Hide:**

Use the name location combo box to set the name of domain display above, under or inside the domain or not display at all.

**Center:**

**Up:**
Add Domain (In nucleotide mode)

When you click the Domain button or choose Edit -> Add Domain in protein mode interface, a domain property dialog box will appear as shown below:

The right area of the property dialog box contains the following settings for the domain:

1. **The ID panel**
   - **ID**: A unique ID can be indicated for the current domain in this textfield. When the domain is created, a default ID value will be automatically indicated. Users are allowed to modify the default value. When inputting a new value, the characters will turn black from gray.
2. **The position panel**
   - **Start**: Assign a start position for the nucleotide domain.
   - **End**: Assign an end position for the nucleotide domain.
   - **Height**: Assign the height for the nucleotide domain. There is no such option in protein mode.

3. **The style panel**
   - **Shape**: The functional domains in nucleotide are represented as polygons. The shape combo box allows the users selecting various polygon elements for nucleotide domain representation.
   - **Rotation Angle**: Specify a rotation angle for the nucleotide domain.
   - **Shape Color**: Select a color for the current domain from the chooser dialog. If the default check box is selected, the software will assign a default color for the domain element.
   - **Gradient**: Select a color gradient for the current domain.
   - **Texture**: Select a texture for the current domain.

4. **The text panel**
   - **Name**: Name of the domain.
   - **Location**: A combo box to set the name of domain display above, under or inside the domain or not display at all.
   - **Font**: Select the font size of the domain name.
   - **Text Color**: Select the font color of the domain name.

5. **The border panel**
   - **Line size**: Change the border size of the current domain.
   - **Dash**: A checkbox for altering the border line into dash line.
   - **Line color**: Select a color for the border line from the chooser dialog.

**Note:**

You can use the position direction combo box to set the start and end position texts display above or under the domain or not display at all.
Use the name **Location** combo box to set the name of domain display above, under or inside the domain or not display at all.

**Add Site**

When you click the *Site* button or choose **Edit -> Add Site** in both protein mode and nucleotide mode, a site property dialog box will appear as shown below:
The right area of the property dialog box contains the following settings for the site:

1. **The ID panel**
   - **ID**: A unique ID can be indicated for the functional site in this textfield. When the functional site is created, a default ID value will be automatically indicated. Users are allowed to modify the default value. When inputting a new value, the characters will turn black from gray.

2. **The site panel**
   - **Position(s)**: Specify the exact positions of functional sites.

3. **The text panel**
   - **Name**: Text of the site.
   - **Font Size**: Select the font size of the text.
   - **Text Color**: Select the font color of the text.

4. **The location panel**
   - **Central X**: Set the x coordinate for the position text.
   - **Central Y**: Set the y coordinate for the position text.
5. The style panel

Shape: The functional sites can be represented as polygons. With this shape combo box, users are allowed to select various polygon elements for functional sites representation.

Rotation Angle: Specify a rotation angle for the functional sites.

Shape Color: Select a color for the current sites from the chooser dialog. If the default check box is selected, the software will assign a default color for the site element.

Gradient: Select a color gradient for the current site.

Texture: Select a texture for the current site.

Width: Assign the width of the functional site.

Height: Assign the height of the functional site.

6. The border panel

Line size: Change the border size of the current site.

Dash: A checkbox for altering the border line into dash line.

Line color: Select a color for the border line from the chooser dialog.

If you have more than one position to draw, please delimit the positions with semicolons. There are three different display ways based on the number of the positions.

➢ One position

Without shape

With shape

➢ Two positions

Without shape
You can use the mouse to drag the text to a proper position in the canvas. If you want to relocate the functional sites, you just need to simply drag the callout lines to a new position.

Use the **Show Position** check box to set the line display with or without position text.
Add Cutline

When you click the CutLine button or choose Edit -> Add CutLine in both protein and nucleotide mode interface, a cutline property dialog box will appear as shown below:

The right area of the property dialog box contains the following settings for the cutline:

1. The ID panel
   ID: A unique ID can be indicated for the cutline in this textfield. When the cutline is created, a default ID value will be automatically indicated. Users are allowed to modify the default value. When inputting a new value, the characters will turn black from gray.

2. The location panel
   Position: Specify the exact position of a cutline.
   Width: Specify the width of a cutline.
   Height: Specify the height of a cutline.

3. The style panel
   Parallel Line: Select the style of a cutline. There are four selectable options, including Line-left, Line-right, Curve-Left and Curve-right.
**Protein dash or Nucleotide dash:** Select the direction of dashed shear line on protein or nucleotide.

4. **The border panel**
   - **Line size:** Select the thickness of the parallel line.
   - **Line Color:** Select the color of the parallel line.

**Add Note**

When you click the *Note* button or choose *Edit -> Add Note*, a note property dialog box will appear as shown below. Alternatively, click on the Note command in the shape toolbar will also open the note property dialog box.
The right area of the property dialog box contains the following settings for the note:

1. **The ID panel**
   - **ID:** A unique ID can be indicated for the note in this textfield.

2. **The text panel**
   - **Text:** Specify text of the note.

3. **The style panel**
   - **Font Size:** Specify font size of the text.
   - **Text color:** Specify color of the text.
   - **Font Style:** Select font style of the text, including Bold, Italic and Plain.
   - **Font:** Select font type of the text.

4. **The location panel**
   - **Central X:** Specify the x coordinate of the note.
   - **Central Y:** Specify the y coordinate of the note.
   - **Angle:** Specify the rotation angle of the note.

5. **The border panel**
   - **Line size:** Change the border size of the current note.
   - **Dash:** A checkbox for altering the border line into dash line.
   - **Line color:** Select a color for the border line from the chooser dialog.
Note: You can use the mouse to drag the text to a proper position in the canvas.

Add Marker

When you click on the Marker command in the shape toolbar, a marker property dialog box will appear as shown below:

The right area of the property dialog box contains the following settings for the marker:

1. **The ID panel**
   - **ID**: A unique ID can be indicated for the marker in this textfield.

2. **The location panel**
   - **Central X**: Specify the x coordinate of the marker.
   - **Central Y**: Specify the y coordinate of the marker.
   - **Width**: Specify the width of the marker.
   - **Height**: Specify the height of the marker.

3. **The text panel**
Name: Specify the name of marker.
Location: Specify the position of the text.
Font Size: Specify the font size of the text.
Text Color: Specify the color of the text.

4. The style panel
   Shape: With the shape combo box, users are allowed to select various polygon elements for marker.
   Rotation Angle: Specify the rotation angle of the marker.
   Shape Color: Select a color for the current marker from the chooser dialog. If the default check box is selected, the software will assign a default color for the marker.
   Gradient: Select a color gradient for the current marker.
   Texture: Select a texture for the current marker.

5. The border panel
   Line size: Change the border size of the current marker.
   Dash: A checkbox for altering the border line into dash line.
   Line color: Select a color for the border line from the chooser dialog.

Note: Use the text Location combo box to set the name of domain display above, under or inside the domain or not display at all.
Add Bracket

When you click on the Bracket command in the shape toolbar, a marker property dialog box will appear as shown below:

The right area of the property dialog box contains the following settings for the bracket:

1. **The ID panel**
   - **ID**: A unique ID can be indicated for the marker in this textfield.

2. **The location panel**
   - **Central X**: Specify the x coordinate of the bracket.
   - **Central Y**: Specify the y coordinate of the bracket.
   - **Width**: Specify the width of the bracket.

3. **The style panel**
   - **Rotation Angle**: Specify the rotation angle of the bracket.
   - **Type**: Select the type of bracket. The following types are provided:

   - **Brace**
Square Bracket

**Color:** Select a color for the current bracket from the chooser dialog.

**Line size:** Change the thickness of the current bracket.

---

## Add Straight Line

When you click on the Straight Line command in the shape toolbar, a straight line property dialog box will appear as shown below:

![Add a straight line dialog box](image)

The right area of the property dialog box contains the following settings for the straight line:

1. **The ID panel**
   - **ID:** A unique ID can be indicated for the straight line in this textfield.

2. **The position panel**
   - **X1 and Y1:** Specify the start position of the straight line.
   - **X2 and Y2:** Specify the end position of the straight line.

3. **The stroke panel**
   - **Line size:** Change the thickness of the current straight line.
   - **Dash:** A checkbox for altering the straight line into dash line.
   - **Line color:** Select a color for the straight line from the chooser dialog.
   - **Style:** Select the style of straight line. There are five styles of line provided:
Add curve

When you click on the Curve command in the shape toolbar, a curve property dialog box will appear as shown below:

The right area of the property dialog box contains the following settings for the curve:
1. **The ID panel**
   - **ID:** A unique ID can be indicated for the curve in this textfield.

2. **The position panel**
   - **X1 and Y1:** Specify the start position of the curve.
   - **X2 and Y2:** Specify the end position of the curve.

3. **The stroke panel**
   - **Line size:** Change the thickness of the current curve.
   - **Dash:** A checkbox for altering the curve into dash line.
   - **Line color:** Select a color for the curve from the chooser dialog.
   - **Style:** Select the style of curve. Similar to straight line, there are five styles provided in the style combo box.

**Add Bezier Curve**

When you click on the Bezier Curve command in the shape toolbar, a Bezier curve property dialog box will appear as shown below:

![Add a bezier curve dialog box](image)

The right area of the property dialog box contains the following settings for the Bezier curve:

1. **The ID panel**
   - **ID:** A unique ID can be indicated for the Bezier curve in this textfield.

2. **The position panel**
**X1 and Y1:** Specify the start position of the Bezier curve.
**X2 and Y2:** Specify the end position of the Bezier curve.

3. **The stroke panel**
   - **Line size:** Change the thickness of the current Bezier curve.
   - **Dash:** A checkbox for altering the Bezier curve into dash line.
   - **Line color:** Select a color for the Bezier curve from the chooser dialog.
   - **Style:** Select the style of Bezier curve. Similar to straight line, there are five styles provided in the style combo box.

**Add Polyline with One Knuckle Point**

When you click on the Polyline with One Knuckle Point command in the shape toolbar, a polyline property dialog box will appear as shown below:

![Polyline property dialog box](image)

The right area of the property dialog box contains the following settings for the polyline:

4. **The ID panel**
   - **ID:** A unique ID can be indicated for the polyline in this textfield.

5. **The position panel**
   - **X1 and Y1:** Specify the start position of the polyline.
   - **X2 and Y2:** Specify the end position of the polyline.

6. **The stroke panel**
   - **Line size:** Change the thickness of the current polyline.
Dash: A checkbox for altering the polyline into dash line.
Line color: Select a color for the polyline from the chooser dialog.
Style: Select the style of polyline. Similar to straight line, there are five styles provided in the style combo box.

Add Polyline with Two Knuckle Points

When you click on the Polyline with Two Knuckle Points command in the shape toolbar, a polyline property dialog box will appear as shown below:

The right area of the property dialog box contains the following settings for the polyline:

1. The ID panel
   ID: A unique ID can be indicated for the polyline in this textfield.

2. The position panel
   X1 and Y1: Specify the start position of the polyline.
   X2 and Y2: Specify the end position of the polyline.

3. The stroke panel
   Line size: Change the thickness of the current polyline.
   Dash: A checkbox for altering the polyline into dash line.
   Line color: Select a color for the polyline from the chooser dialog.
   Style: Select the style of polyline. Similar to straight line, there are five styles provided in the style combo box.
Canvas Size

Choose the Edit -> Canvas size can open a canvas size property dialog box.

![Canvas Size dialog box](image)

**Width**: Set the width of current canvas (pix).

**Height**: Set the height of current canvas (pix).

**Keep width-height ratio check box**: Keep the width-height ratio when setting the canvas.

Mouse operation

For convenience, we add new functions of mouse operation in IBS 1.0. Here, we used an instance from G. Liang’s work to depict the usage.
1. Selecting and Dragging
When clicking on an element, such as protein or nucleotide sequence, shaped site, marker or domain (in nucleotide mode), four yellow anchor points and a red anchor point will appear around the element. You can drag the yellow anchor points to change the size of the element, or drag the red anchor point to rotate the element. Notably, protein, nucleotide and text cannot be zoom in and zoom out by mouse dragging. Besides, to move the element, you should not place the mouse on the anchor points.
Here we present three particular examples to further illustrate the selecting and dragging of drawing elements.

The selecting and dragging of nucleotide domains
When clicking on the domain in nucleotide diagram, several yellow anchor points appear. By dragging the yellow anchor points, the corresponding domain can be zoomed in and out. Likewise, to change the angle of a domain, you just need to rotate the red anchor points. The effects are shown below:
The selecting and dragging of bracket elements
When clicking on the bracket elements, three anchor points appear. You can drag the blue anchor to adjust the length of the bracket. Also, by dragging of the red anchor, you can rotate the bracket around the yellow anchor.
The selecting and dragging of line elements
After selecting the line elements, blue anchor points will appear on both ends of the line. When dragging any of the anchor points, you can relocate the endpoint of your line.

Before dragging

After dragging

If you draw a curve or one-knuckle-point polyline, there will be a red control point in the middle of the line. When you drag the red point, the shape of the curve or polyline will be changed.

Before dragging

After dragging
If you draw a Bezier curve or two-knuckle-point polyline, there will be two control point in the middle of the line. When you drag any of the control point, the shape of the curve or polyline will be changed.

Before dragging

After dragging
2. **Double-clicking of mouse**

When double-clicking the drawing elements, a property dialog box will appear as shown below. From the property dialog, you can edit the appearance of drawing elements. The below picture shows an example of editing a functional domain in Kdm2a.

![Property dialog box for editing a functional domain in Kdm2a.](image)

**Keyboard operation**

1. After selecting an element (except protein or nucleotide sequences) by mouse clicking, you can press "→" to move left, "←" to move right, "↑" to move up (except the functional domain) or "↓" to move down (except the functional domain).
2. Press "Delete" (Del) to delete a selected element (including protein and nucleotide sequences).
3. After selecting a polygon marker by mouse clicking, you can press "Ctrl+→" to enlarge the width, "Ctrl+←" to narrow the width, "Ctrl+↑" to enlarge the height or "Ctrl+↓" to reduce the height.
4. Press "Ctrl+C" and "Ctrl+V" to duplicate the drawing element (including protein and nucleotide sequences).
5. Mouse-clicking on the starting points of our five different kinds of line elements, simultaneously, pressing the “Ctrl++“, you can put the starting point horizontally as shown below.

*Before pressing “Ctrl++“*

*After pressing “Ctrl++“*

6. Similarly, mouse-clicking on the starting points of our five different kinds of line elements, simultaneously, pressing the “Ctrl+|“, you can put the starting point vertically as shown below.

*Before pressing “Ctrl+|“*

*After pressing “Ctrl+|“*
7. Mouse-clicking on the knuckle points of a polyline and pressing the “Ctrl+R” simultaneously, you can change the angle to 90° as shown below:

Before pressing “Ctrl+R”

[Diagram showing the angle before pressing Ctrl+R]

After pressing “Ctrl+R”

[Diagram showing the angle after pressing Ctrl+R]

8. Press “Ctrl+U” to undo the current operation.
9. Press “Ctrl+E” to redo the latest operation.

Release Note

1. Feb. 2nd, 2008, the final packages of online demo and local stand-alone softwares of DOG 1.0 are released.
2. Mar. 25th, 2008, a bug on opening project was found and fixed.
3. Apr. 19th, 2008, Dr. Fernan Aguero (San Martin, Argentina), had contacted and reminded us that our software could not be installed or worked under Linux/Unix systems. We have re-compiled the package of DOG 1.0 for Linux/Unix to fix the bug.
4. May 18th, 2008, a new function of “Mouse-clicking” was added in the software. And the figure format was extended to be exported in JPEG format.
6. Jan. 3rd, 2009, DOG version 1.0.3 was released. We fixed a bug that cannot create a new file under Mac OS X. The Acknowledgement list and contact information were added into the new version.
7. Jan. 19th, 2009, DOG web server was moved to new website (http://dog.biocuckoo.org) and a new GPS logo was put into use.
8. Apr. 7th, 2009, DOG version 1.0.4 was released. The DOG image can be exported in TIFF format with 300 or 600dpi. Image Format was added in Tools menu.
9. Jun. 10th, 2009, DOG version 1.0.5 was released. Express the domain length with relative length instead of absolute length.
11. Nov. 6th, 2011, the DOG 2.0 beta version was released. In contrast to the previous version of DOG, the new version supports more functions, including multi-protein display, SVG (Scalable Vector Graphics) image output, canvas resize and draw line or arrow.
12. Aug. 24th, 2014, the IBS 1.0 was released. In IBS 1.0, a brand new dual-mode user interface was developed for supporting both protein and nucleotide presentation. We have also designed various drawing elements for the purpose of providing an unconstrained drawing environment to users. To help users prepare diagram in a more aesthetic and concise appearance, three professional renderers were implemented in IBS.
13. Nov. 17th, 2015, the IBS 1.0.1 was released. The new version has optimized the batch export function and reduced memory footprint. Besides, a command line export module was also added for the mass generation of IBS images.
